

Drum Dust Collector

Drum dust collectors are available in CFM sizing 400, 600 CFM

The drum dust collector is designed to connect to a blast cabinet as a method of dust extraction. The drum after blasting use will require regular emptying of dust and fines to maintain maximum operating efficiency. We suggest weekly or monthly depending on the amount of blasting work carried out.

Shown in the right hand picture is the drum filter. For optimum dust extraction performance the filter can be sent away for cleaning or a new filter purchased once the filter becomes clogged with too much dust.

The drum dust collector is the base model in our range of dust extraction devices

Also available on a stand with legs please contact us for further details.
